

Bonding

Tooth-colored bonding material

Bonding can fill spaces

A transformed smile

With bonding, we can close spaces between teeth, lengthen small or misshapen teeth, or whiten stained or dark teeth. We can shape and color a single tooth or improve your entire smile. When teeth are chipped or beginning to wear, bonding can protect them from damage and restore their original looks.

The procedure

Bonding your teeth with a material called resin requires just one appointment. First, we roughen and prepare the teeth and apply a conditioning gel. Then we place the resin, sculpt it to the desired shape, and harden it with a harmless, high-intensity light.

Once in place, bonded restorations are very strong. Bonding can drastically improve your smile—the final result is beautiful and natural looking teeth.
